Title :-
Deletion of a Leaf Node From a Binary Search Tree (BST)

Problem Statement :-
To write a C++ program to delete a specified leaf node from a Binary Search Tree while maintaining the BST property.

Objectives :-

- To Understand the concept of a Binary Search tree.
- To insert nodes into a BST.
- To delete a specified leaf node.
- To display the BST Using Inorder traversal.

Algorithm :-

1. Start the program.
2. Create an empty Binary Search Tree.

3. Insert the given element into the BST.
4. Display the BST using inorder traversal.
5. Enter the value of the leaf node to be deleted.
6. Search for the specified node.
7. Check whether the node has no children.
8. If it is a leaf node, delete it and return NULL.
9. If is not a leaf node, display a message
10. Display the Updated BST using inorder traversal
11. Stop the program.
