Algorithm:

1. Start the program.
2. Create an empty Binary Search Tree.
3. Insert the given elements into the BST.
4. Display the BST using inorder traversal.
5. Enter the value of the leaf node to be deleted.
6. Search for the specified node.
7. Check whether the node has no children.
8. If it is a leaf node, delete it and return NULL.
9. If it is not a leaf node, display a message.
10. Display the updated BST using inorder traversal.
11. Stop the program.
